Q&A
Quick Poll

How many of you use Qt Creator for Qt Quick application development?
Quick Overview

Available in Qt 5.0.0 and onwards.
1) Qt Creator 2.6.1

2) Qt Quick 1 – Qt 4.8.x and Qt 5.0.0 and Qt Quick 2 – Qt 5.0.0

(Deviations are indicated with ✫ )
do {
    var pill = getPill()
} while (pill.color === Qt.color("blue"))
It understands the QML code model

Easy to use
Lets you create applications even if you are not a coder.

Currently supports Qt Quick 1. Support for Qt Quick 2 is ongoing.
Debugging
Client Server architecture

1) A TCP server is started that listens to connections on a specified port.

3) Server advertises available services.

![TCP/IP Diagram]

2) A TCP client connects to specified port.

4) Service clients connect to respective services. (Only one client per service is accepted. All clients share the same port.)

⚠️ An open port presents a security risk. Ensure that the port is properly protected by a firewall.
1) Enable TCP Server

Compile with qmake argument
CONFIG+=declarative_debug for Qt Quick 1 apps or
CONFIG+=qml_debug for Qt Quick 2 apps.

2) Specify Port

- Pass -qmljsdebugger=port:xxxx as a command line argument.
- [,host:<ip address>] optional arg specifies the IP address
- [,block] optional arg blocks the GUI thread until a profiling
  client is connected to the TCP server.

3) Attach a Debugging Client

Connect a debugging client to the TCP server at known address
and port.
Just press the Debug button!
To debug a running application that has QML debugging enabled, specify the port and the corresponding kit.
Inspect the QML object tree when debugger is not on a debug break.

Modify properties of QML elements.
'Application on top' tool tries to ensure the debugee is always the top level window.

'Select' tool selects UI elements in the view. It can be used to identify a particular element and view its properties.

'Zoom' tool provides zoom in and zoom out functionality.

For Qt Quick 2 applications, Select tool also provides zoom functionality. The Zoom tool is hence disabled.
Console APIs*
~ Firebug console APIs
Logging (console.log(), console.warn(), etc.)
Profiling (console.time(), console.timeEnd(), etc.)
console.assert(), console.trace(), etc.

Interactive console in Qt Creator
Evaluate expressions
Filter messages
Find functionality

* For Qt Quick 1 applications, a subset of console APIs is available.
Modify register values of locals.

Modify property values of QML objects.

Watch expressions.

Evaluate JavaScript expressions.

Break on JavaScript exceptions.*

Select, zoom UI elements in the application view.

* Available in Qt 5.0.0 and onwards.
Profiling: Overview

Re-uses Debugging Client Server architecture

1) A TCP server is started that listens to connections on a specified port.

3) Server advertises available profiling services.

2) A TCP client connects to specified port.

4) Profiling service clients connect to respective profiling services.
   (Only one client per service is accepted. All clients share the same port.)

   • [,host:<ip address>] optional arg specifies the IP address
   • [,block] optional arg blocks the GUI thread until a profiling
     client is connected to the TCP server.

3) Attach a Profiling Client
   Connect a profiling client to the TCP server at known address
   and port.
Press the QML Profiler Start Button

- Start
- Stop
- Toggle Recording

Analyze Mode
To profile a running application that has QML debugging enabled, specify the host and port.
To start an application with the profiler,
qmlprofiler [options] [program] [program args]

To profile a running application that has QML debugging enabled,
qmlprofiler [options] -attach [hostname]

Options
• -fromStart to record as soon as the QML engine is started.
• -p [-port] <number> specifies the TCP/IP port to use.

Commands
• r [record] to toggle recording.
• q [quit] to quit.

Profile data is saved in XML format.

Available in Qt 5.0.0 and onwards.
